

The Solution to Chinese drywall

The AbissoCleanse staff has invested an extensive amount of time into testing and creating an effective protocol.

Our protocol has been proven to work multiple times in field studies along with clearance tests to prove its efficiency.

What is Chinese Drywall?

Tainted drywall was imported from China during the housing boom, and is estimated to have been installed in over 100,000 homes. That drywall has been found to emit dangerous gases that are not present in U.S made drywall.

Contaminants being released from the imported drywall include sulfur dioxide, hydrogen sulfide, carbon disulfide, carbonyl sulfide and many others. These pollutants continuously off-gas from the drywall into the indoor air. There is no solid evidence of how these compounds became present in the drywall. Some theories are pollutants were in the mine the gypsum came from, bacterial or microbial imbedding during shipping, and also possibly in manufacturing.

Due to the corrosive nature of these compounds, homeowners have reported problems with air conditioning systems, electronics and in appliances with copper components.

Homeowners Worries Confirmed

Owners of a home on Montauk Point Crossing -- one of the areas hardest hit by the defective drywall -- initially

agreed to let their home builder begin repair work on their house, but ordered the work halted because a foul odor remained in the home after the drywall was removed.

So What Is The problem?

The sulfide gases which are released from the Chinese drywall are leaching into the surrounding porous material. The contaminates have penetrated all items of the home.

The first step is to remove all drywall as surgically as possible. The contaminant has been removed, so now what? How do we treat the concrete block and framing? How do we remove all of these remaining sulfide compounds?

The solution is the uniquely formulated protocol that AbissoCleanse has developed. This protocol utilizes a specialized product that is able to mechanically break down these sulfide compounds to their basic elements and neutralize them. At the same time this product is also able to breakdown any microbial, bacterial, and fungal contamination.

These sulfide compounds need to be eliminated. Our protocol allows us to do just that without creating any volatile organic compounds (V.O.C.)

This House Is Clean

It is our knowledge that the removal of the contaminated drywall alone does not truly eliminate all pollution. You must also neutralize all cross contamination in the home.

To ensure that we have been completely effective we use a 3rd party environmental testing company to collect core samples of wood and block from the homes. This gives the home owner a clearance test certifying that the home is clean.
